

Radulomyces molaris sur branche morte de chêne
Photos Bernard Clesse – Couvin, 13/10/2025

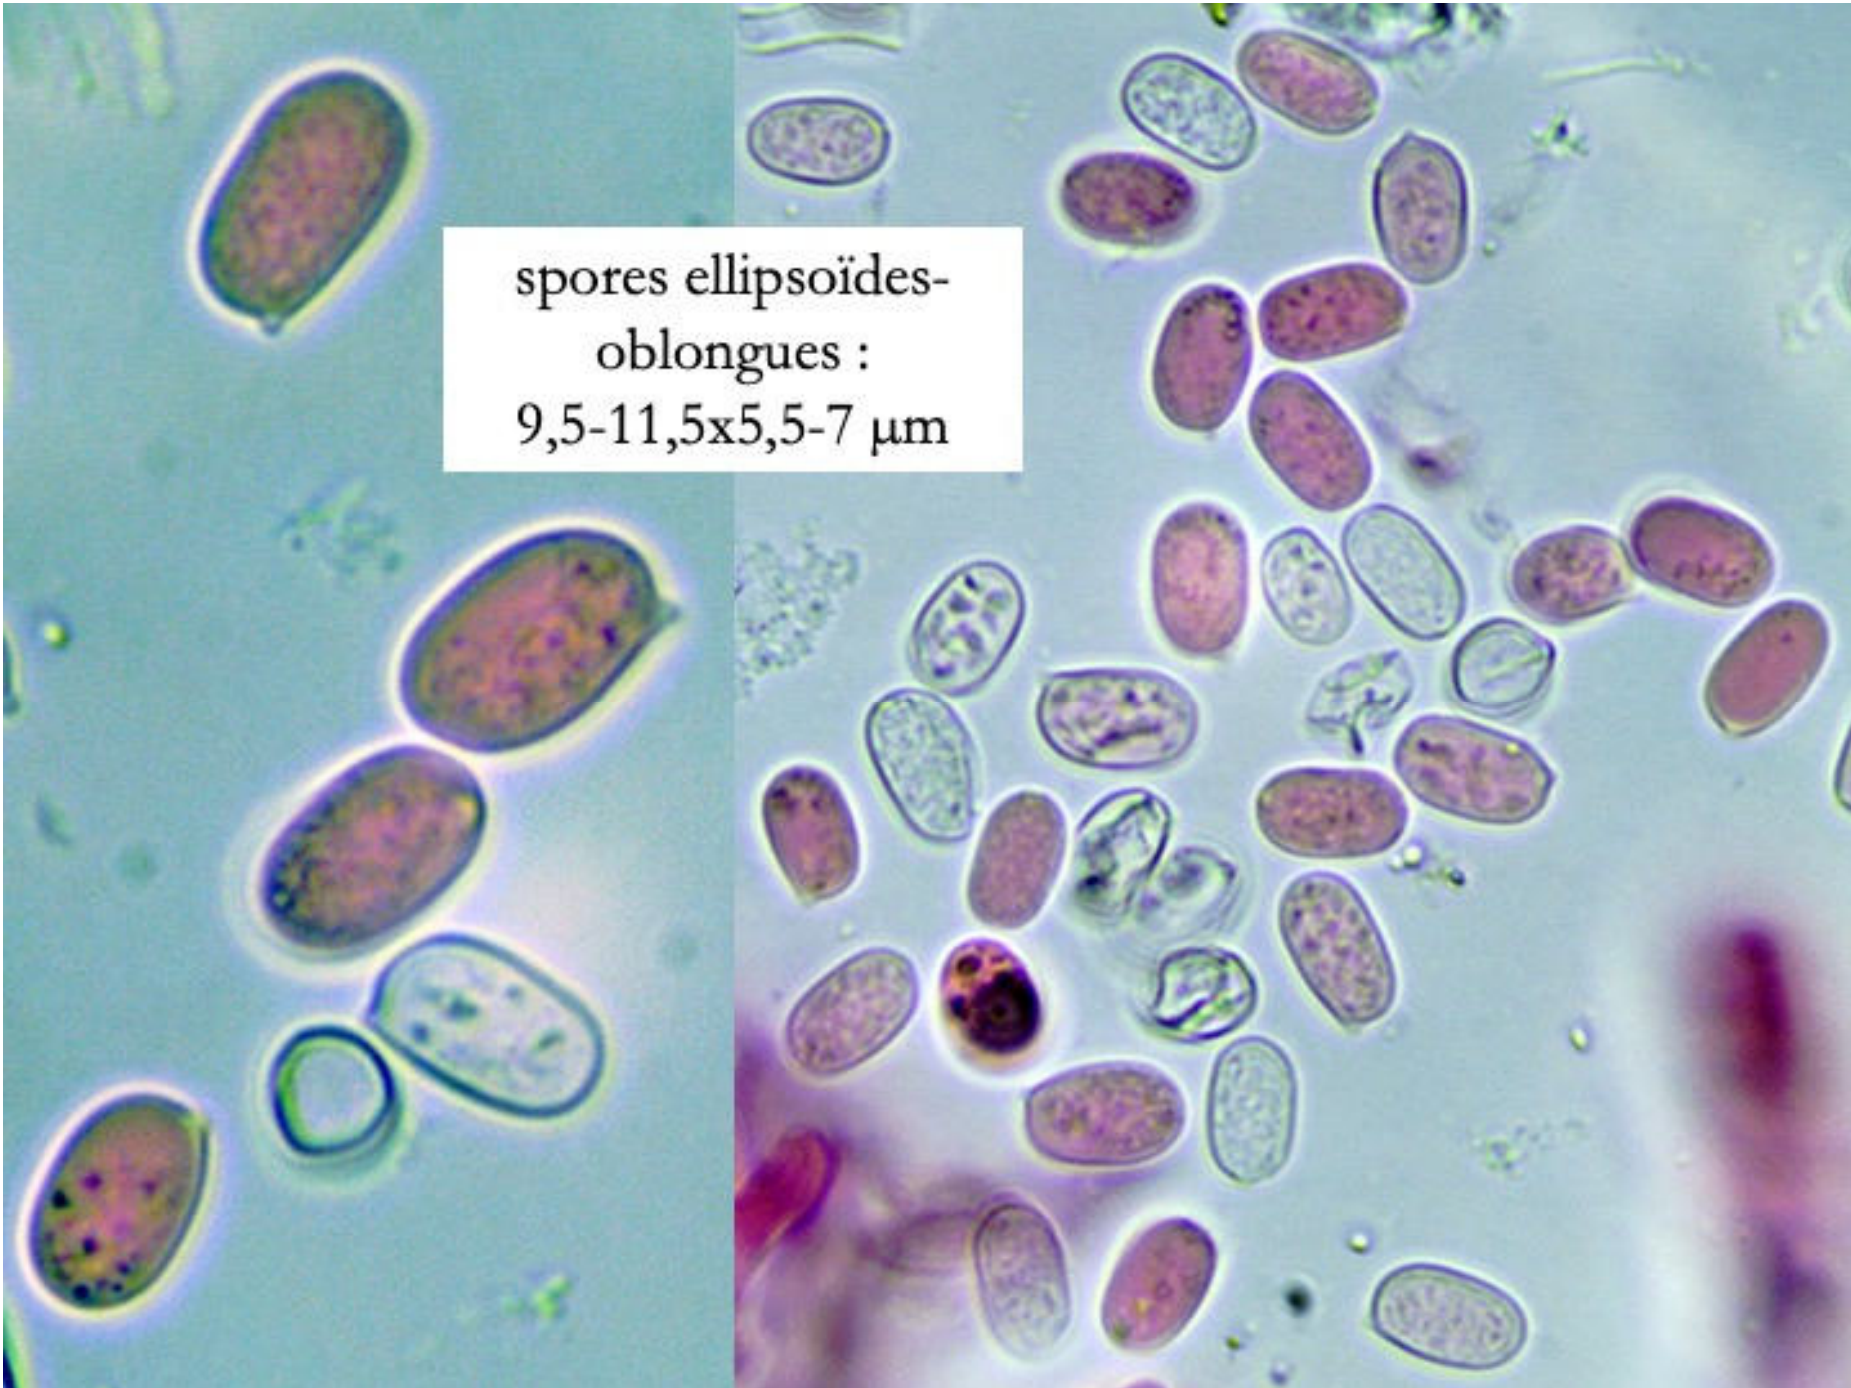

basidioles très guttulées

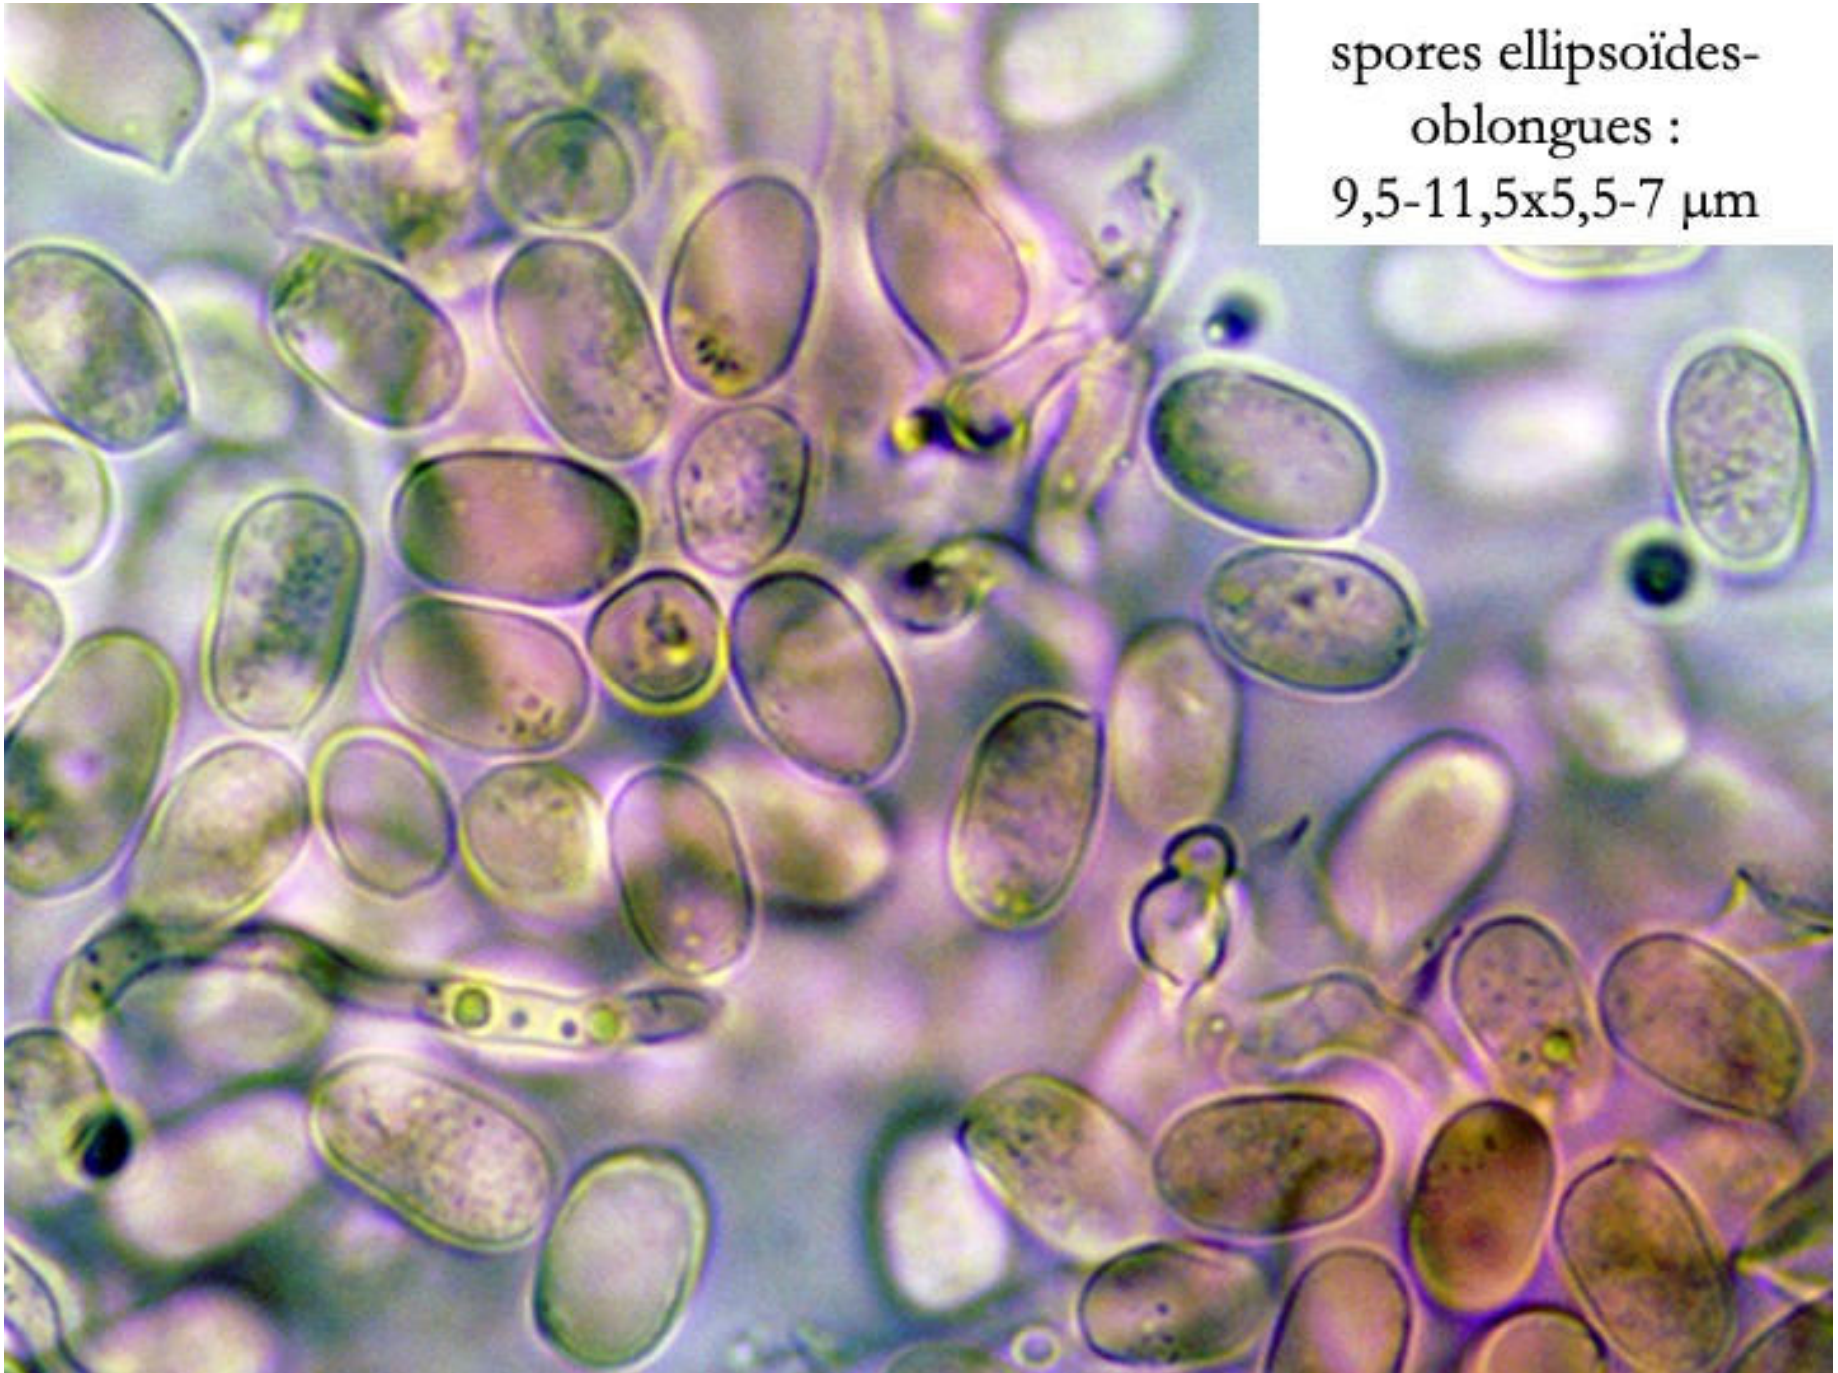

monomitique, hyphes
bouclées, hyphes
subiculaires
à parois épaisses

A composite microscopic image showing numerous ellipsoidal-oblong spores. The spores are stained, showing a distinct outer shell and internal granular or vacuolar structures. They are distributed across the field of view, with some appearing in small groups and others isolated. The background is a light, slightly textured blue-grey.

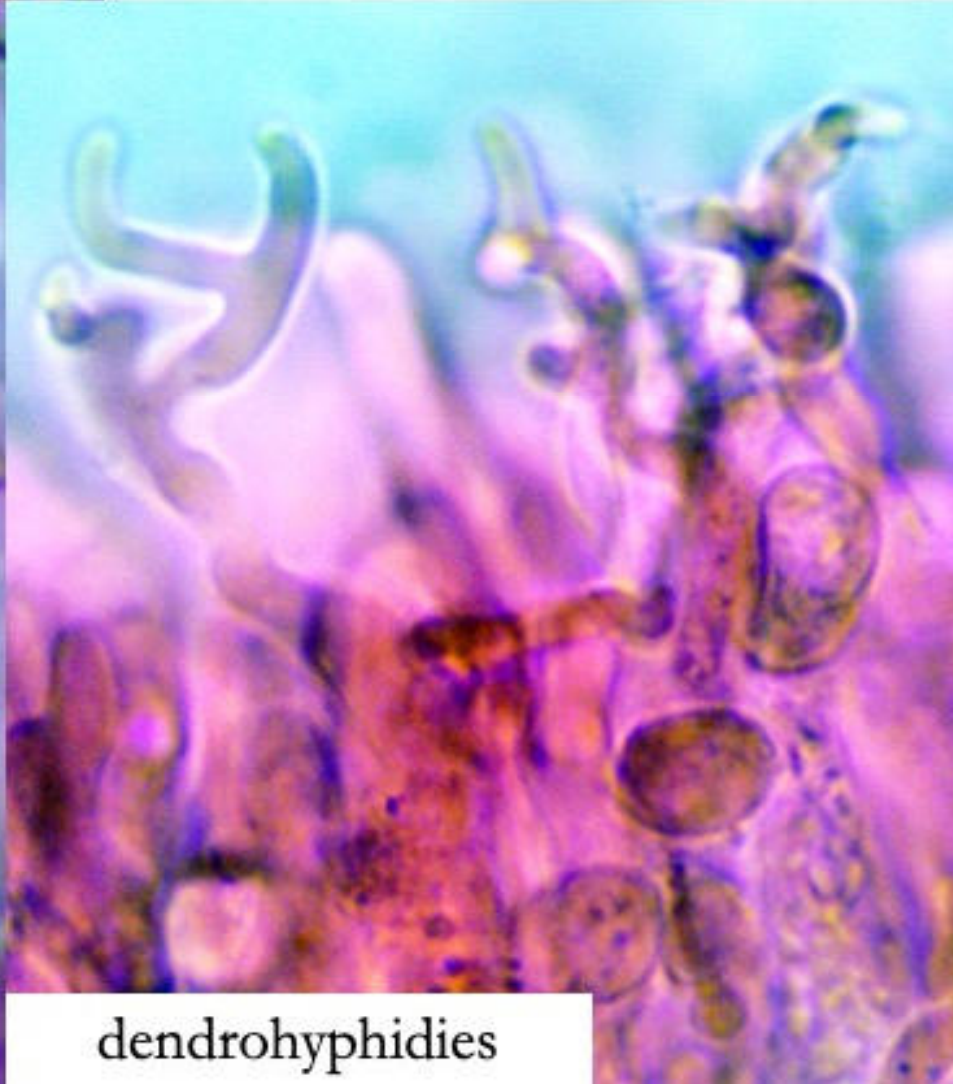

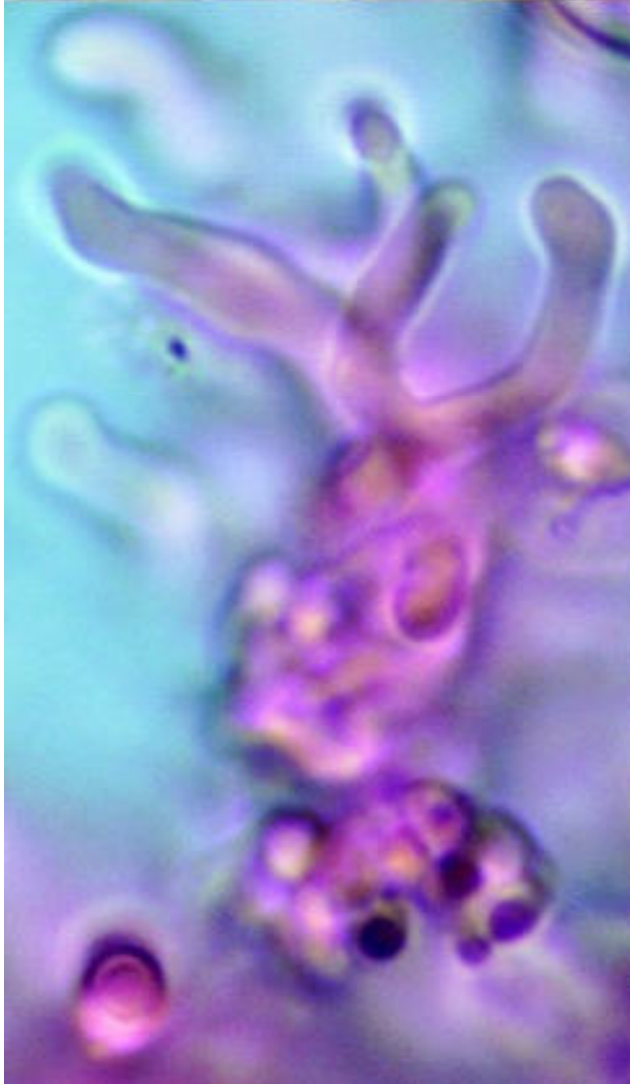

spores ellipsoïdes-
oblongues :
9,5-11,5x5,5-7 μm

spores ellipsoïdes-
oblongues :
