

Golovinomyces asterum* var. *solidaginis* sur *Solidago canadensis
Fiche conçue et réalisée par Daniel Deschuyteneer

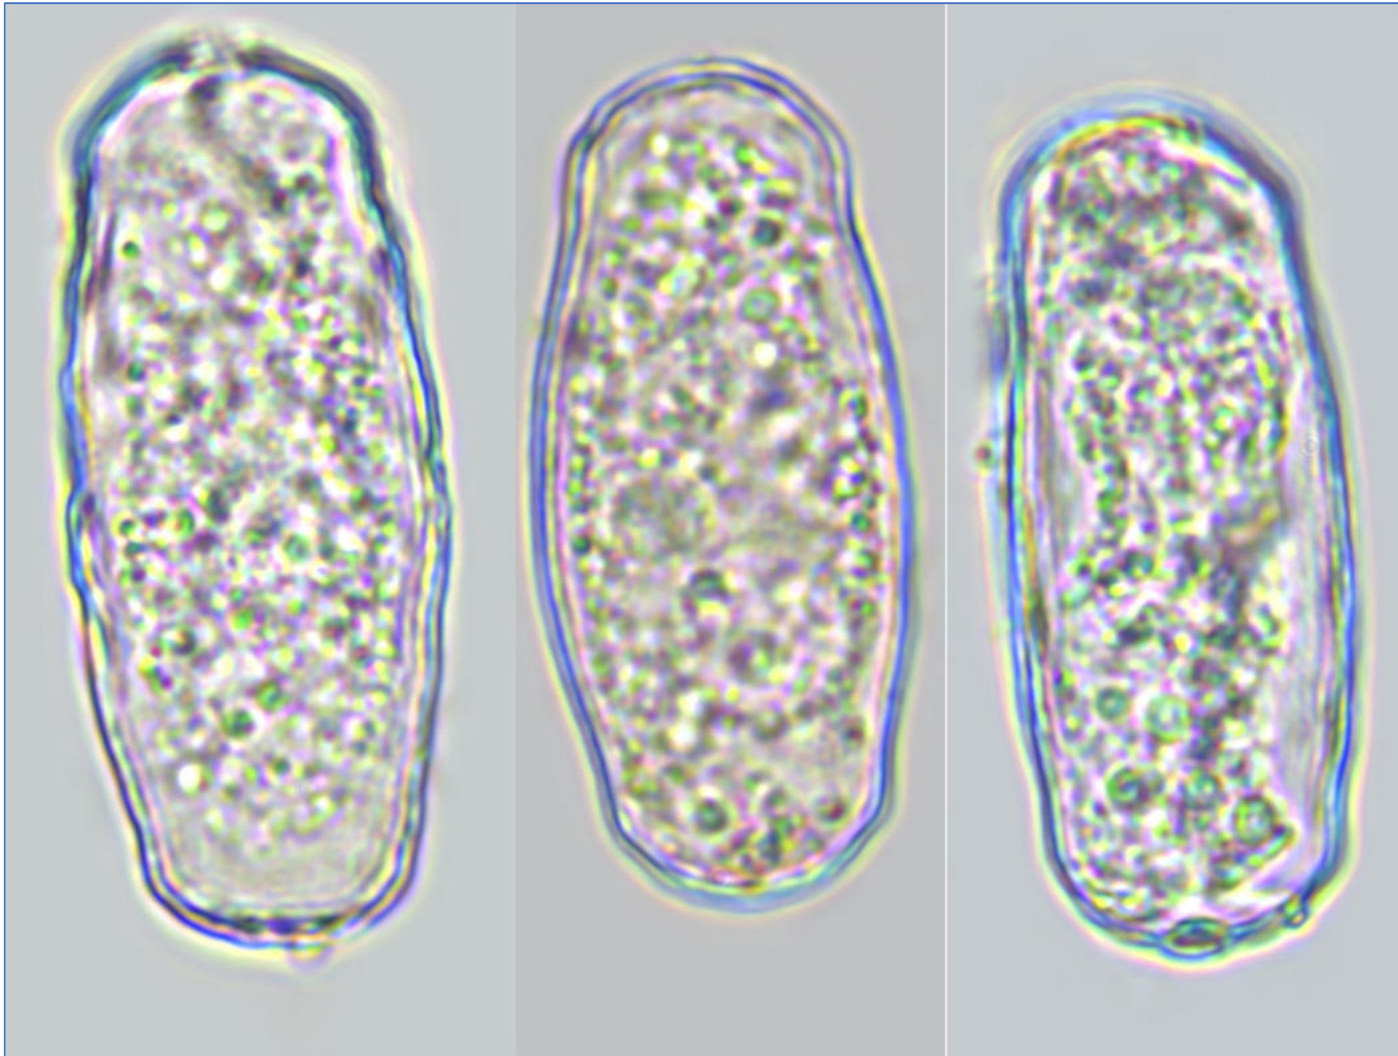

Jeunes conidies elliptiques

Vieilles conidies devenant rectangulaires, avec une paroi d'épaisseur irrégulière avant germination

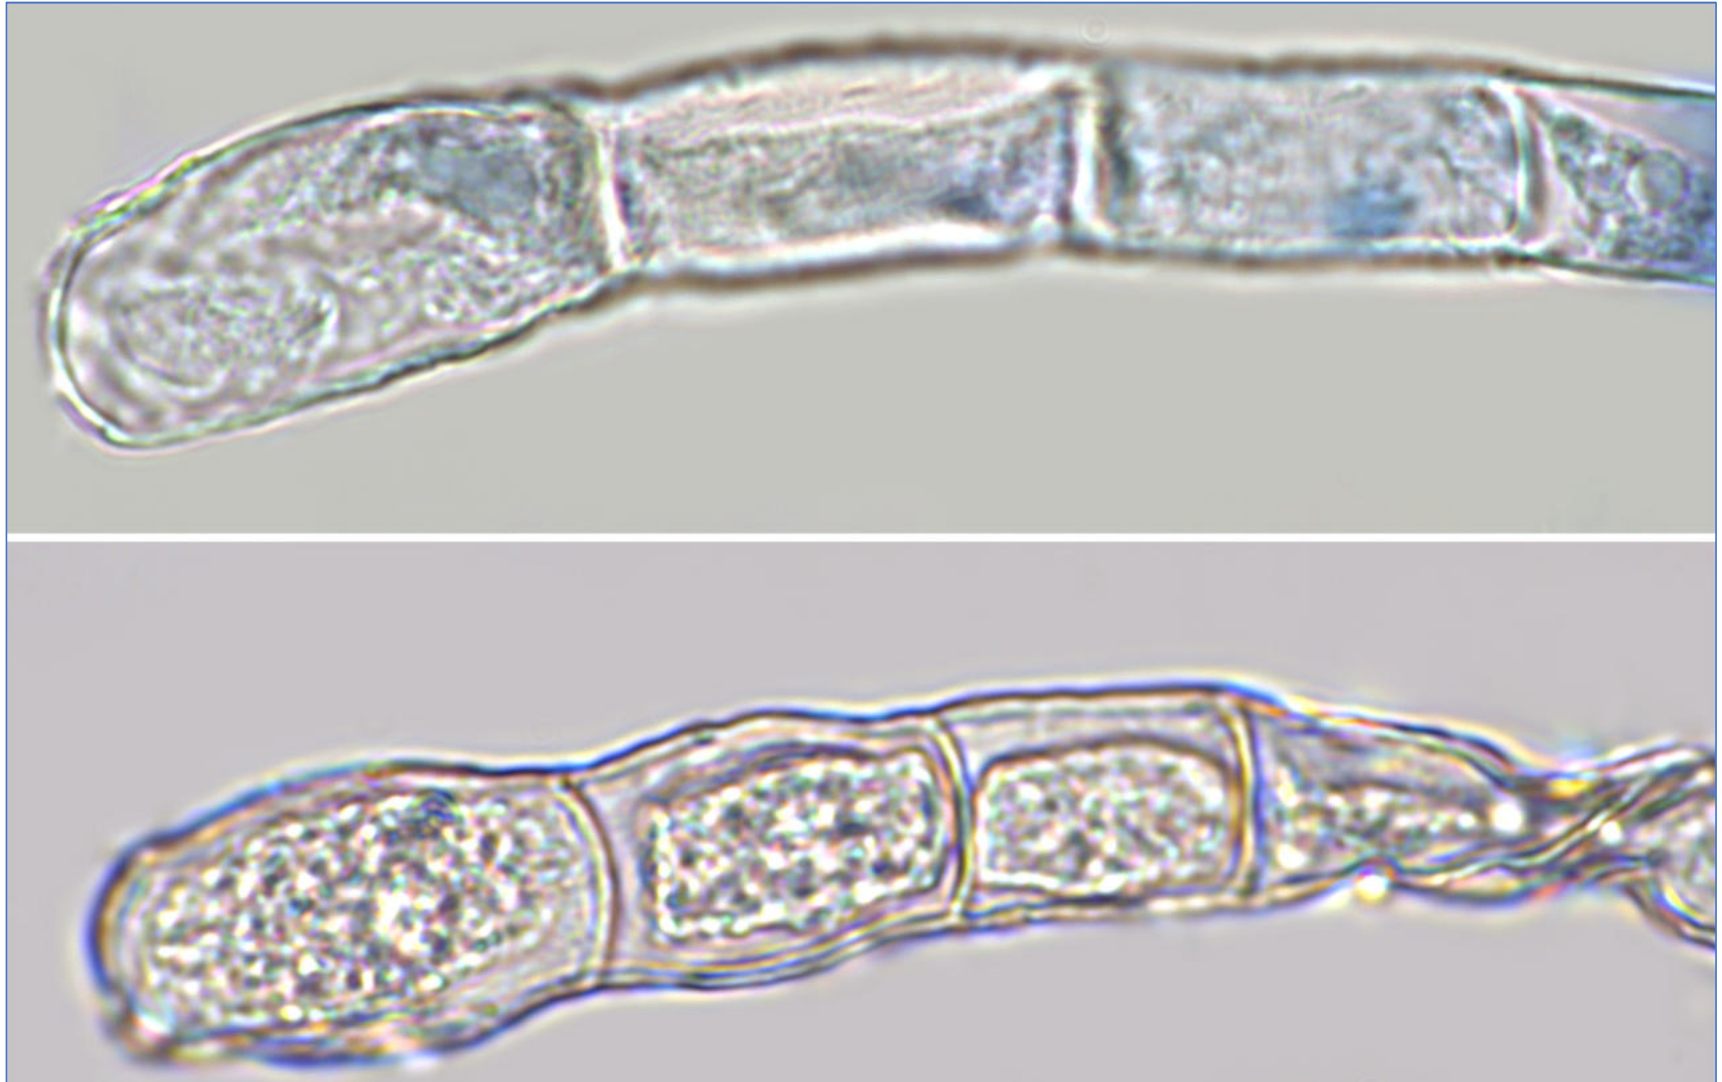

Germination de conidies

Germination de conidies

Conidiophores

Avec l'aide de Jorik Swier :

The book "The Powdery Mildews (Erysiphales) of Britain and Ireland – an Identification Guide and Census Catalogue for Wales" lists two species of mildew in the host plant Solidago:

- Golovinomyces asterum var. solidaginis FB absent; A 2(-3).
- Podosphaera erigerontis-canadensis FB present; A (6-)8.

In this sample, we do not see any fibrosin bodies (FB), which would indicate **Golovinomyces asterum var. solidaginis**.
